

The challenge

This customer required a tiled floor after 30 days, but had previously had a bad experience with other flowing screeds.

The solution

Gyvlon FD, was selected due to its increased drying speed, twice as fast as conventional screeds and it doesn't shrink or crack.

Results

The UFH was turned on gently after 7 days on a commissioning cycle with the floor being dry after 26 days; the customer tiled after 32 days.

Cox Building
